Fig S6. Close view of binding mode of compounds $\mathbf{1}, \mathbf{2}, \mathbf{3}, 4,5$ and 6. ..... 12
Fig S7. Close view of binding mode of compounds $\mathbf{7}, \mathbf{8}, \mathbf{9}, \mathbf{1 0}, \mathbf{1}$ and $\mathbf{1 2}$. ..... 13
Fig S8. Close view of binding mode of compounds 13, 14, 15, 16, 17, 18, 19 and 20. ..... 14
Fig S9. Chemical structures of inhibitors for structural comparison. ..... 15
Fig Sio. Binding mode comparison of the dihydroquinolin ligands bound to bromodomain proteins. ..... 16
Fig Sı1. Binding mode comparison of the 9 H -purine ligands bound to bromodomain proteins. ..... 17

Fig S1. Comparison of docked pose obtained by the fragment-docking program SEED (carbon atoms in magenta) and binding mode in the crystal structure (carbon atoms in yellow) of fragments $\mathbf{1}, \mathbf{2}, \mathbf{3}$ and 8. Heteroatoms are colored as follows: N (blue), O (red), S (yellow), and Br (maroon). The six conserved water molecules in the Kac binding pocket are labeled W1 to W6.

Fig S2. False positive hits from fragment docking by SEED. These fragments were among the 13 fragments purchased from 30 top ranked ones, but binding is not observed by X -ray crystallography (soaking into BRPFı apo crystals).

Fig S3. Similarity matrix of compounds $\mathbf{1}$ to $\mathbf{1 6}$. The similarity (Tanimoto coefficient) was calculated based on the RDKit fingerprint which is implemented in the RDKit ${ }^{1}$ toolkit. The size and darkness (vertical legend on the right) of the circles indicate similarity. The hierarchical complete-link algorithm with the R programming language generates six clusters (orange boxes).

## BromoScan assay ${ }^{2}$

BromoScan assays on BRPFı for the 14 compounds were performed at DiscoveRx. $\mathrm{T}_{7}$ phage strains displaying bromodomains were grown in parallel in 24 -well blocks in an E. coli host derived from the BL21 strain. E. coli were grown to log-phase and infected with $\mathrm{T}_{7}$ phage from a frozen stock (multiplicity of infection=0.4) and incubated with shaking at $32^{\circ} \mathrm{C}$ until lysis ( $90-150$ minutes). The lysates were centrifuged ( $5,000 \mathrm{xg}$ ) and filtered ( $0.2 \mu \mathrm{~m}$ ) to remove cell debris. Streptavidin-coated magnetic beads were treated with biotinylated small molecule or acetylated peptide ligands for 30 minutes at room temperature to generate affinity resins for bromodomain assays. The liganded beads were blocked with excess biotin and washed with blocking buffer (SeaBlock (Pierce), 1 \% BSA, 0.05 \% Tween 20, 1 mM DTT) to remove unbound ligand and to reduce non-specific phage binding. Binding reactions were assembled by combining bromodomains, liganded affinity beads, and test compounds in $1 x$ binding buffer ( $17 \%$ SeaBlock, o.33x PBS, o.04\% Tween 20, 0.02\% BSA, o.004\% Sodium azide, 7.4 mM DTT). Test compounds were prepared as 1000 X stocks in $100 \%$ DMSO and subsequently diluted 1:10 in monoethylene glycol (MEG) to create stocks at 100X the screening concentration (resulting stock solution is $10 \% \mathrm{DMSO} / 90 \% \mathrm{MEG}$ ). The compounds were then diluted directly into the assays such that the final concentration of DMSO and MEG were $0.1 \%$ and $0.9 \%$, respectively. All reactions were performed in polystyrene 96-well plates in a final volume of 0.135 ml .
The assay plates were incubated at room temperature with shaking for 1 hour and the affinity beads were washed with wash buffer ( $1 \times$ PBS, $0.05 \%$ Tween 20 ). The beads were then re-suspended in elution buffer ( $1 x$ PBS, $0.05 \%$ Tween $20,2 \mu \mathrm{M}$ nonbiotinylated affinity ligand) and incubated at room temperature with shaking for 30 minutes. The bromodomain concentration in the eluates was measured by qPCR. Binding constants (Kds) were calculated with a standard dose-response curve using the Hill equation:

$$
\text { Response }=\text { Background }+\frac{\text { Signal }- \text { Background }}{1+\left(\mathrm{K}_{\mathrm{d}}^{\text {Hill Slope }} / \text { Dose }^{\text {Hill Slope }}\right)}
$$

Curves were fitted using a non-linear least square fit with the Levenberg-Marquardt algorithm.

Fig S4. Dose-response curves in duplicates for the 16 compounds tested for binding to the BRPF1 bromodomain in the competition binding assay at DiscoveRx.

Fig S5. IC50 value of compound 20 determined by the AlphaScreen binding assay ${ }^{3}$ at Reaction Biology.

Table S1. X-ray data collection and refinement statistics for complex structures of the BRPF1 bromodomain and compounds 1, 2,3 and 4 .

4NYX (CREBBP)

Fig S9. Chemical structures of inhibitors for structural comparison.
(a)N-[1,3-dimethyl-2-oxo-6-(piperidin-1-yl)-2,3-dihydro-1H-benzimidazol-5-yl]-2-methoxybenzamide,
(b) 6-(5-bromo-2-methoxyphenyl)-9H-purin-2-amine,
(c) $(3 \mathrm{R})-\mathrm{N}-[3-(3,4$-dihydroquinolin-1 $(2 \mathrm{H})$-yl)propyl]-3-methyl-2-oxo-1,2,3,4-tetrahydroquinoxaline-5carboxamide, and (d) (3R)-N-[3-(7-methoxy-3,4-dihydroquinolin-1 $(2 \mathrm{H})$-yl)propyl]-3-methyl-2-oxo-1,2,3,4-tetrahydroquinoxaline-5-carboxamide.

Fig Sio. Comparison of the binding modes of dihydroquinoline ligands in BRPFı (top) and CREBBP (bottom). The structural alignment (middle) shows that the binding modes are different. (Top) In BRPF1, the bromine substituent of fragment 9 , the trifluromethyl of $\mathbf{1 0}$, and the carboxylate of $\mathbf{1 4}$ occupy the same position, while fragment $\mathbf{1 2}(5 \mathrm{EPR})$ is devoid of substituent and its orientation is slightly shifted.

Fig Sir. Comparison of the binding modes of mercaptopurine fragments 3 and 4 in BRPF1 (top) with the previously reported 2-amine-9H-purine ligands of the BRD9 (4XY8, bottom) and BRD4 (4XY9, bottom) bromodomains. The structural alignment (middle) shows that the binding modes are different which is consistent with the fact that these ligands share only the purine scaffold.
